

Lesson 16

T Category

- No evidence of primary tumor
- Site of primary tumor is unknown
- T0 assigned in above cases
 - Based on clinical suspicion of primary site
 - Nodes or distant metastasis pathologically c/w primary site
- Examples
 - Axillary nodes c/w ductal ca, no apparent breast tumor
 - T0 N1 M0
 - Lung mass c/w renal cell ca, no apparent kidney tumor
 - T0 N0 M1

- Synchronous tumors of same histology in one organ
 - Simultaneous multiple tumors
 - Assign T by most advanced tumor, highest T category
- Indicate multiplicity
 - (m) suffix, T2(m)
 - (number) suffix, T2(5)
- Example: two T2 and one T3 tumors in one organ
 - Assign T3(m) or T3(3)
- Registries must record (m) in AJCC T Suffix
 - Indicates burden of disease for data analysis

- Synchronous primary tumors in paired organs
 - Simultaneous multiple tumors
 - Stage and report independently

- Example: T2 tumor in lt adrenal, T3 tumor in rt adrenal
 - Report as two cancers
 - Do **NOT** use (m) suffix
 - Report lt adrenal cancer and assign T2
 - Report rt adrenal cancer and assign T3

- Multiplicity is criterion for T category in following sites
 - Thyroid
 - Assign T1 – T4 and assign T suffix (s) for solitary or (m) for multifocal
 - Liver
 - T3 and T4 used for multiple tumors
 - Ovary
 - T1b or higher for both ovaries
- T Category Suffix for thyroid
 - Suffix includes (s) and (m) to be used only in the thyroid
 - (s) indicates solitary tumor in thyroid only
 - (m) indicates multifocal tumor in thyroid only, not considered separate independent primaries
